

Feasibility Result	Proposed Solution / Benefits	Current Situation / Considerations	Type
✓ Technically feasible	Web/desktop pharmacy system with database (MySQL/PostgreSQL); barcode scanning; expiry-date and low-stock alerts; cloud backup.	Manual record-keeping of medicines and sales; stock-outs and expired drugs go unnoticed; dispensing errors; no real-time inventory tracking.	Technical
✓ Operationally feasible	Faster sales/dispensing; automatic stock deduction and reorder alerts; easy batch tracking; reduced workload; better customer satisfaction.	Manual stock counting is time-consuming; difficulty tracking batches and expiry dates; long customer waiting time; resistance to change possible.	Operational
✓ Cost-effective	Saves time/money; reduces losses from expired drugs and shortages; lower admin costs; long-term efficiency gains.	Cost of software, hardware (POS, barcode scanner, receipt printer), training, and maintenance.	Economic
✓ Legally feasible	Keep controlled-drug logs and audit trail; implement data privacy/security policies; licensed pharmacist oversight.	Need compliance with Drug Authority regulations, controlled-substance records, and patient data protection.	Legal
✓ Achievable timeline	Estimated timeline 3–6 months (requirements → design → development → testing → deployment).	Manual processes delay reporting, ordering from suppliers, and inventory counts.	Schedule

Cost–Benefit Analysis – Pharmacy Management System

Estimated Value (per year)	Benefits	Estimated Cost	Description	Category
\$2,500 savings in stock/dispensing errors	Centralized, automated inventory and sales reduce errors and delays.	\$1,000 – \$3,000	Development (in-house) or purchase of Pharmacy Management System license	Software
\$1,500 saved in staff workload	Faster checkout and dispensing; reduced manual work.	\$800 – \$2,000	PC/server, POS terminal, barcode scanner, receipt printer, UPS, backup drive	Hardware
Higher productivity (= \$800)	Smooth transition, efficient use of system.	\$200 – \$500	Pharmacist/staff training sessions	Training
\$1,000 saved from downtime	Ensures system reliability and data security.	\$400 – \$800	Annual software updates, bug fixes, server hosting/cloud backup	Maintenance
\$600 saved	Eliminated with PMS → paperless system.	\$600 annually	Current manual system (paper registers, invoices, stock sheets, printing)	Administration
Intangible but high value	Faster service, instant drug availability check, improved customer satisfaction	–	Long waits and manual lookup of drug availability	Customer Experience
\$3,000 saved from fewer expired drugs and stock-outs	Expiry alerts and smart reordering reduce wasted stock.	–	Expired or overstocked medicines under the manual system	Inventory Losses

Summary

Total Estimated Costs (first year): \$2,400 – \$6,300
Total Estimated Annual Benefits/Savings: \$9,400+
Payback Period: Within 1 year (= 3–8 months)

Conclusion: The Pharmacy Management System is economically feasible, with clear cost savings and long-term value.
